

BOTTLE-GLASS

The novelty is seen in a **BOTTLE WHIT MOVABLE BOTTOM**. When the two elements are separated, **the higher part, glass, can be “planted” on the bottom!**

The internal circle of the bottom, as well as the external low part of the glass are threaded, allowing their easy dis/connection. The same dis/connection can be made by the bottle neck with the central part of the bottom.

It goes without say that both connections can be realized with fine elaborated connecting surfaces, without threading.

The proposed bottle-glass is **intended to be used in domestic and the tourism and catering services**. It is especially useful for excursions and picnicks where the **PET-glasses are in abundance interspersed, polluting the environment**.
